Data are mean (SD) in the treated set except for lipid parameters, which are adjusted mean ± standard error based on ANCOVA with treatment, region and eGFR at baseline as fixed effects and baseline HbA1c and the baseline value for the endpoint in question as linear covariates.

Data are normalized to a standard reference range, except for eGFR and lipids.

*Changes from baseline at last value on treatment, except for eGFR and lipids which are changes from baseline at week 52 or follow-up.
