Incident CKD was defined as eGFR<60 mL/min/1.73m<sup>2</sup> at year 4 in individuals eGFR ≥60 mL/min/1.73m<sup>2</sup> year at baseline. All values are mean±SD (standard deviation) unless labeled otherwise; \* Median [IQR – interquartile range]; † Geometric Mean (SD range). BMI, body mass index; AC, Anglo-Celt; SE, southern European; OE, other European; Ab, Aboriginal; ACE-I, angiotensin-converting enzyme inhibitor; ARB, angiotensin receptor blocker; OHA, oral hypoglycaemic agent; eGFR, estimated glomerular filtration rate by CKD Epidemiology Collaboration equation; PAD, peripheral arterial disease; CVD, cerebrovascular disease; IHD, ischemic heart disease.

Only participants with complete data were included in each model. The most parsimonious clinical model was derived as described in methods, followed by

## SUPPLEMENTARY DATA

inclusion of biomarkers with significant independent predictive value (clinical + biomarkers model 1), then all significant biomarkers across the four definitions of rapid eGFR decline were forced into the clinical model (clinical + biomarkers model 2). \* A 2.72 fold change in mean peak area ratio of APOA4, C1QB, CD5L or IBP3 corresponds to a change of 1 in natural logarithm transformed (APOA4, C1QB, CD5L or IBP3), respectively. † Based on optimal cut-off defined by Youden Index. ‡ Based on internal validation by bootstrap resampling. § The performance of this model was compared to the clinical model applied to the same 317 individuals. NI = not included. LRT = likelihood ratio test, H-L = Hosmer-Lemeshow, PPV = positive predictive value, NPV = negative predictive value, AUC = area under the curve, IDI = integrated discrimination index, NRI (>0) = category-free/continuous net reclassification index, NRI<sub>R</sub> = NRI for rapid decliners, NRI<sub>NR</sub> = NRI for non-rapid decliners, IDI<sub>R</sub> = IDI for rapid decliners, IDI<sub>NR</sub> = IDI for non-rapid decliners. Rapid and non-rapid refer to the two categories of eGFR decline  $\geq 5$  and  $< 5$  mL/min/1.73m<sup>2</sup>/yr.

SUPPLEMENTARY DATA

**Supplementary Figure S1.** The observed probabilities were plotted against predicted probabilities over deciles of predictions (from Hosmer-Lemeshow goodness-of-fit test) for the clinical model, represented by black-filled circles (•), and the clinical + biomarkers model, represented by the triangles (Δ). A. eGFR trajectory, B. Incident CKD, C. eGFR decline  $\geq 30\%$ , D. Annual decline  $\geq 5\text{mL}/\text{min}/1.73\text{m}^2/\text{yr}$ .
