

**Supplementary Fig. 1.** The DIPP Study cohort.

Supplementary Table 1: Comparison between those children who carried the high risk HLA genotype and those with moderate risk genotypes. T1D, Type 1 diabetes; ICA, islet cell antibodies; DAA, diabetes-associated autoantibodies. \* $P < 0.001$ , † $P = 0.004$ , ‡ $P = 0.03$ , § $P = 0.04$ .

	High risk	Moderate risk
	n (%)	
Total	1575 (21.3)	5835 (78.7)
Males	829 (52.6)	3068 (52.6)
Progression to T1D	80 (5.1)	100 (1.7)*
T1D affected family members at index child's birth	53 (3.4)	124 (2.1)†
Participation in the intervention study	82 (5.2)	137 (2.3)*
ICA-based seroconversion	325 (20.6)	848 (14.5)*
Positivity for $\geq 2$ DAAs <sup>a</sup>	141 (43.4)	250 (29.5)*
Persistent autoantibody positivity <sup>a</sup>	194 (59.7)	487 (56.4)*
Persistently positive for $\geq 2$ DAAs <sup>a</sup>	109 (33.5)	174 (20.5)*
	Years	
Age at diagnosis	5.1 (1.0–12.0)	4.9 (0.9–12.5)
Age at seroconversion	3.5 (0.3–13.3)	4.0 (0.2–13.7)‡
Age at maximal DAA status	4.2 (0.5–13.3)	5.0 (0.5–13.7)§
Delay from seroconversion to diagnosis	2.8 (0.1–9.0)	2.8 (0.0–10.9)

<sup>a</sup>% of ICA-positive subjects. Details regarding the DAA combinations; see Supplementary Table 3.

Supplementary Table 2. 5-year predictive characteristics of the four diabetes-associated autoantibodies (DAA): Islet cell antibodies (ICA), insulin antibodies (IAA), glutamic acid antibodies (GADA), and islet antigen-2 antibodies (IA-2A). T1D+/ All+, progressors/all subjects positive for the given specificity; CI<sub>95%</sub>, 95% confidence interval; prefix “p”, persistently positive autoantibody; PPV and NPV, positive and negative predictive value. In the case of defined autoantibody categories, each individual is included in only one category.

Combinations of autoantibodies	T1D+/All+, n	Sensitivity, % (CI <sub>95%</sub> )	Specificity, % (CI <sub>95%</sub> )	PPV, % (CI <sub>95%</sub> )	NPV, % (CI <sub>95%</sub> )	Cumulative risk, % (CI <sub>95%</sub> )
